Download the resources of this challenge

U'll get capture.flag.pcap

Open it in wireshark

U'll see in info of the packets that 5876→9001 and 9001→5876, 43928→80 and 80→43928, 9002→56370 and 56370→9002

We have to focus on the packets in which the ports involved like 9001 and 9002 cause these are custom made, so someone is talking in these ports .

Why not 80? Cause this a web traffic ports (http).

Go to edit→ find packets → in the search bar filter it by port 9001 i.e "tcp.port==9001"

After filtering,

Right click any packet→got to follow→go to tcp stream

Change show as to ascii

U can now read the convo which was happening between 5876 and 9001 port

In that they gave us two important info i.e

1. We'hv to decrypt the file using this command

openssl des3 -d -salt -in file.des3 -out file.txt -k supersecretpassword123

2. The file is sent over the port 9002

So in the search bar filter it by 9002 ports i.e"tcp.port==9002"

Right click any packet→got to follow→go to tcp stream

Change show as to raw bytes

Save the file as file.des3

Why ?

Because in the above(we got from reading the convo) command, file name is file.des3

Now decrypt the file using the above command

U'll get the file.txt file

Open it u'll get the flag i.e

picoCTF{nc_73115_411_0ee7267a}

done!!
