picoCTF- Torrent Analyze

Download the resource of the challenge

U have a torrent.pcap file

Open it in wireshark, in hints of this challenge they said to enable BT-DHT protocol.
So go to analyze → enabled protocols → check the BT-DHT protocol.

Now in the search bar search bt-dht so that u'll get packets which are using bt-dht protocols.

In the info column check which hash is most occurring.

That hash is nothing but info_hash(basically the hash of the file which u r downloading)

"Why focus on the most frequent hash?

In BitTorrent, your computer sends Get_peers requests to find other peers who have the file.
The more your computer asks for a specific info_hash, the more actively it's downloading that file. So the most frequent hash = the file being downloaded."

U'll find this hash repeats the most

"e2467cbf021192c241367b892230dc1e05c0580e " i.e the info_hash.

Search in google "hash" file name because torrent saves it's hash for all the files in it's database

So when u search for it's hash u'll get the file name

The file name u get is

"ubuntu-19.10-desktop-amd64.iso "

And the flag is picoCTF{ubuntu-19.10-desktop-amd64.iso}

done!!
