TryHackMe-Digital Forensics Rooms

Room 1 - Intro to Digital Forensics

What is Digital Forensics :-

Digital Forensics is basically the use of computer science to investigate digital evidence for a legal purpose.

Used to investigate crimes when digital devices are involved (laptops, phones, USBs, cameras etc.).

For Ex :- Police arrive at a crime scene and find a laptop, smartphone, and USB. They cannot just plug them into their own computer because that would taint the evidence. They need proper digital forensics procedure.

Digital Forensics Process :-

The basic plan once you reach a crime scene (we'll understand through an example):-

Practical Example :-

Scenario :- A cat named Gado has been kidnapped. The kidnapper sent us a ransom letter as a MS Word document.

We are given :-

- ransom-letter.doc (original)
- ransom-letter.pdf (converted version)
- letter-image.jpg (extracted from the doc)
- ransom-letter-2.zip

Tool :- pdftinfo (install with `sudo apt install poppler-utils`)

Command :-

```
pdftinfo ransom-letter.pdf
```

Look at the Author field - that's ur answer for Q1.

EXIF Data (Photo Metadata) :-

Every photo from a phone or camera has tons of metadata baked in.

Tool :- exiftool (install with `sudo apt install libimage-exiftool-perl`)

Command to read everything :-

```
exiftool letter-image.jpg
```

To filter just what u want :-

```
exiftool letter-image.jpg | grep -i gps  
exiftool letter-image.jpg | grep -i model
```

Finding the Street :-

Take the GPS coordinates from exiftool output. Format will look like :-

```
GPS Position : 51 deg 31' 4.00" N, 0 deg 5' 48.30" W
```

Convert it for Google Maps :-

1. Replace "deg" with °
2. Remove extra whitespace
3. Should look like 51°31'4.0"N 0°5'48.3"W

Paste that into Google Maps and the street name shows up. That's ur Q2 answer.
